Combined research overview

Source picker · SYNTHETIC

Generated 2026-11-04 | Profile UI_DEMO

This overview combines source records, completed local tests and explicitly comparable calculations. It does not establish a diagnosis or a perfect genome. Missing or incompatible evidence stays visible.

Distinct contents	Source records	Saved reports	Completed local tests
1	2	0	0

Source datasets

Source	File / reference / version	Evidence / content identity
1 / MyHeritage	MyHeritage.vcf Unknown / Version not declared	Measured (declared) Not assessed SHA e9721d1e84a41852
2 / 23andMe	23andMe.vcf Unknown / Version not declared	Measured (declared) Not assessed SHA e9721d1e84a41852

Identical content hashes do not count as additional measurements. Complete IDs, SHA-256 values and provenance are preserved in calculated-research.json.

Ancestry calculations

No compatible combined ancestry calculation is available for this profile yet.

Health and local results

No completed local research tests are included in this snapshot.

Consumer chip data can contribute measured positions without WGS. Genotype consensus, provider statements, self-report and model predictions remain separate evidence. Diagnoses, drug advice and incompatible risks are never averaged into a medical finding. Missing data is not a negative result.

Provider reports and profile facts

No provider reports are included in this snapshot.

Weighting and traceability

Marker-specific callability and documented model quality only for explicitly comparable models. No weight from filename, file size, provider prestige or download date.

Full machine-readable sources, profile metadata and run references are provided in the JSON alongside this PDF. Source reports remain available independently.
